
How to make a fresh install from svn?

Posted by crisscross - 2007/08/18 17:07

Can anyone direct me on how to make a fresh install of fireboard from the svn? I have installed tortoise svn and checked the latest files from trunk. How do I install this as a component in joomla? I tried uploading the files via ftp to my site and manually make the sql-queries but then of course the component will not show up in joomla back-end. Is there an installer already in the trunk? Sorry for my "newbiness" but this is the first time I tried installing something from svn.

Quick & Dirty:

1. Install a previously published installer package (1.0.1? ...)
2. Checkout SVN (wherever you like)
3. Copy ...

fireboard/trunk/administrator/components/com_fireboard TO YOURWEB/administrator/components
AND

fireboard/trunk/components/com_fireboard TO YOURWEB/components
from SVN (or move or link)

4. Delete all Tables jos_fb_* with phpMyAdmin (if ANY!)

After that FB Backend panel shows up with the two options for clean install:

- import from JB
- install clean empty tables

If you don't want to delete all tables, i'd suggest you to check each table by hand!

Use the file fireboard/trunk/FB_databaseStructure.txt to compare.

And for sure create missing fields. I recommend you to use and enforce exactly THE SAME order!

Test with us :-)

Thank you very much! I did it all and all went fine except that counters for threads and replies where zero. ReCount categories and stats gave me a fatal error on memory (32 mb), probably because I have over 100,000 posts. That might be something to look into because many on shared hosts might have problem with changing php.ini for more php-allocated memory.

Looks like you're right...

reCountBoards obviously fetches a query containing all messages into one object. This is a problem for big installs.

I reported it...

any better solution?

Well if the code would iterate on the mysql result manually...

...PHP would never fetch all messages into local memory, instead php could only maintain one single message in memory...

```
class.fireboard.php @330
$database->setQuery("select id, time, parent, catid from #__fb_messages order by id asc");
$lis = $database->loadObjectList();
```

```
Look at "loadObjectList":
function loadObjectList( $key=" " ) {
...
    while ($row = mysql_fetch_object( $cur )) {
...
        $array = $row;
```

...although, i'm not sure how this is accordable with the Joomla standard sequences.

Really that bad design?

? function getNumRows

Looks like there's no iterative method per design :unsure: :ohmy:
