## Comparing database read-amount

Posted by klp29 - 2007/04/18 08:57

---

THIS IS GREAT NEWS!!!! :whistle:

We just migrated one site from JoomlaBoard to SMF due to the fact, that JoomlaBoard simply couldn't run properly when we eventually reached 500.000+ posts.

We WOULD like an integrated forum instead of bridging SMF, so FireBoard seems to be sent like an angle from heaven :kiss:

I have a question, though: how would FireBoard handle 500.000+ posts better than JoomlaBoard?

When comparing the amount of read instructions to the database in JoomlaBoard with the same in FireBoard, how do the two components compare?

=====

How about just installing it and comparing it? We have to still work on the SQL, but for this we need a bit more time and more people :) So, even if FB can't handle it keep working with your solution till we get to it

cheers

Nice suggestion, but "no thanks" :)

We're not going to import 500.000 posts into a beta just to check out performance, when YOU can easily tell us, if the database read-structure has been improved :laugh:

I'm afraid not much for now. I have to use this forum on a 100k site too (not as much as yours), so anyway I have to optimize it. So, for now, keep in touch. It was already a long step from JB to FB.

Cheers
