
CCS failure in UserList?

Posted by roland76 - 2007/08/31 22:07

Hello,

I have the newest SVN on a test side. Everything works fine and much faster as before! Great work!

The only problem on my site is the Userlist... If I show the userlist the main-part of the side now left align instead of center... Have a look here.

Greetings, Roland

The avatars size pushes your design away. Try for example : `.usl_avatar {width:50px;}` and add it to your forum.css

Thanks for the answer. But I don't think that the reason is the avator. Now I have the list without avator and the same problem... <http://test1.simple-quality.de/de/forum/123.html>

Find the `userlist.php` file that your template is using (found in the `template//plugin` directory) and remove line 613 which should be a duplicated `statement` which causes the function to bleed to full width regardless of the template used.

Hope this helps.
