
Adding a Category crashes Joomla

Posted by hatchmo - 2007/09/17 01:47

The FireBoard beta worked fine. I just upgraded to "Stable" 1.0.3. Immediately after installation, I added text to 3 boxes to create a new Category. Joomla Administrator crashed with this message:

```
fbforum:: store failed
Unknown column 'class_sfx' in 'field list'
SQL=INSERT INTO joomla1_fb_categories ('id','parent','name','locked',
'moderated','pub_access','pub_recurse','admin_recurse','ordering',
'review','description','class_sfx','headerdesc')
VALUES ('','0','CategoryName','0','1','0','0','23','0','9999','0','CategoryDescription','','Category')
```

Now, the Joomla Control panel no longer lets me select any Component or Module operation, nor does it let me install any Component or Module, including FireBoard. Each time I select one of these from the Administration menu, I am thrown into the login screen for Control Panel. It would appear that permissions got hosed somehow. Any ideas on how I recover?

- Joomla 1.0.13
FireBoard 1.0.3

Apparently, when the Joomla Control Panel upgrades from 1.0.0 to 1.0.3 FireBoard, it leaves untouched any FireBoard-specific tables in the database. I hand-deleted (actually submitted a query string) to delete all FireBoard-specific tables and reinstalled. All is well now. Except... Joomla Control Panel still jumps to the login page 3 out of 4 times instead of to a Component page when I click on a Component.
