
Spell Checker

Posted by steve - 2007/04/24 01:50

I think a spell checker would be a great addition to what looks like becoming one of the best Joomla components around.:)

Oh my, yes. A spell-checker with red-underlining, etc.

I do also think a spellchecker would be great.

But actually, since I've been looking around for, and tested, a lot of solutions I found that Firefox and the spellchecker-plugin that could be found as extension is a far better solution for most people. It works in every page You like to use it since it is in the browser instead of the pages. If Firefox isn't the browser for You maybe Google spellchecker is an alternative? (IE and FF at least, maby more browsers is supported.)

Understand me right here now, there is a lot of third parts spellchecker to use all ready, maybe it takes to much time for the developers of Fireboard if the should create a new spellchecker as well.

That would be really great, but NOT ONLY for English language :) Do you know any which supports several languages?

If this Q was for me:

Both Google and the speller for FF I am using is for Swedish.

Google have most language of them.

I agree with this, spell checking can be best achieved client side.

There is also Ispell which is the spell check that vBulletin uses. That runs in IE or any IE based browser (Like avant browser).

So for those of us who dont use Mozilla regularly (Sadly I am one of them. Avant browser lured me in a while back, lol) all I have to do is right click in any text field and I can have an active spellcheck.

Ispell can also be called upon using javascript, which is how the wysiwyg in vbulletin uses it.

www.iespell.com

yeah..this should be a perfect idea. I really hope this becomes a new feature to the fireborad projects.

Yes I agree also that this should be a client side function and Firefox inbuilt spellcheck and Ispell are both very good solutions.

Please don't bloat Fireboard with features that are (better) achieved by other applications :(

I don't want to seem to dump water on the party, but as a Firefox user I'd much rather see new features like polls and better user access control before we add a spell checker. Don't take it personally guys, I just know there's only so much the dev team can do. :)
