
function.tabber.php calls non-existent file named

Posted by hughesjr - 2007/08/10 17:11

Using fireboard 1.0.2 RC2.

This file:

components/com_fireboard/template/default/plugin/recentposts/function.tabber.php

calls this non-existent file:

components/com_fireboard/template/default/plugin/recentposts/example-print.css

This still happening in 1.0.3. The message is logged in the websites error log though it does not appear to affect the performance of Fireboard.

I found the following post on Google (but can't find the original post):

http://www.bestofjoomla.com/component/option,com_fireboard/Itemid,38/id,19165/catid,66/func,fb_pdf/

I downloaded the css file from the suggested website and copied it into the relevant folder. This seems to have solved the problem.

Thanks for the fix. I opened up a bug report in the tracker.
