## FB lastpost module, the class suffix not working?

Posted by moonstar2005 - 2008/02/06 21:59

---

just wondering, has anyone ran into Style problem when posting the module class suffix outputing the FB lastest post module? I set a module class suffix in the parameters, but when I check in firebug, I don't see the div (moduletable\_recentpost) for it. Is there something I have to change in the php file?

Backend, in the parameter section in the lastest forum module on the right, where you can set your own CSS style? The section that is call the "module class suffix" is where you can set your own css style. After you set it, you turn on Firebug (firefox tool to help with style) to see which div/cotainer it is in, I didn't see the class I set for that module class so I can style that particular lastest forum.

Ok, I just confirmed. the FB Lastpost module is not being outputted as a moduletable so I am not able to set a style in the module class suffix. Did anyone else have the same problem? I spent the last 1 hours trying to figure this out.
