
Solved:Can I use mambots/plugin-ins in this version?

Posted by Lowkey - 2007/09/06 15:31

I still use 1.0.1 on my site and I have applied a hack from a thread on this forum, to enable mambots in posts.

Has this function been introduced to the official build yet?

If not, can somebody figure out a way around it?

In admin panel I saw there is a button that says it can enable mambots so I would say yes; I didn't test if they actually work ;) But it should.

Is it that you don't understand what a bot is? If it is here's an explanation.

Mambots

A Mambot is a small, task-oriented function that intercepts content before it is displayed and manipulates it in some way. Joomla! provides a number of Mambots in the core distribution, e.g. WYSIWYG editors, but there are many other mambots available for specific tasks. Some 3rd Party developer components have their own mambots which need to be installed in order to make the component work properly.

In Joomla! 1.5 mambots will be renamed plugins.

Plugins: The new name for mambots. In addition, some 3rd party components, modules and mambots themselves have plugins.

In short bots/plugins add extra functionality to Joomla/Fireboard. You must enable mambot support if you want to use something like the Discussbot, Searchbot, Allvideosplugin, etc, in Fireboard.

Bots/Plugins were the most difficult thing for me to wrap my head around when I first started using Joomla and each one has their own "syntax" you need to use in order for them to work properly. Please read the documentation on how to utilize your particular bot.

Hope this helps.

I want to use mambots in my fireboard too. although all configurations are correct i only get the code. I use joomla 1.5 with fireboard 1.04. maybe it doesnt work because of the inequality of mambots and plugins. any Idea?

What? How about telling us WHAT mambot you're trying to use? Is your mambot compatible with J1.5?

The mambot nino (for Latex) works fine in content items. but when i want to use it in a forum post, everything i get is
{nino}
\sqrt {3}
{/nino}

or with another mambot:

```
{tab=first tab}
some text
here
{tab=other tab}
some more text here
{/tabs}
```

is it possible to use mambots in J1.5 with fireboard?

Have you checked with the developer of the plugin to see if it is compatible with 1.5 AND can be used with FireBoard?

can you give me an example of a mambot which works with J1.5 and Fireboard so that i can test if mambots in general work?

Re:Solved:Can I use mambots/plugin-ins in this versi

Posted by Hazzar - 2008/02/23 04:01

I've tried it with the "old" joomla 1.0.15 now and everything works as it should. so Im pretty sure it has to do something with the incompatibility of J1.5 and Fireboard.

Until this bugs are vanished I think I will use a wrapper with the 1.0 jommla and a clear page template to embed it into my site.

Has anyone got plugins working within messages with Joomla 1.5?

I have upgraded the Joomla installation and they have stopped working.

They do not work on Joomla 1.5.

I can not figure it out! Why fireboard reads the xtylo code inside the forum in Joomla 1.0.x using xtylo 1.2 but will not read the xtylo code in Joomla 1.5.6 using xtylo 1.3?

My code works in Joomla 1.5.6, it inserts it just fine, but then fireboard acts like it is not reading the xtylo plugin, it just shows the code only no style!

If you have an idea, please let me know!
