## Fatal error: Undefined class name '\jtoolbarhelper'

Posted by dniezby - 2008/06/12 23:52

---

I just uploaded 1.1.0 and when I go to the Admin section I get this error:

Fatal error: Undefined class name 'jtoolbarhelper' in

/home/xxx/public\_html/xxx/administrator/components/com\_fireboard/toolbar.fireboard.php on line 17

Obviously the XXX are place holders for the true directories

BTW - Joomla 1.0.12

Sorry for the repost but I didn't find the others until after I posted this one. Either way, I don't see that it was resolved yet.

Any updates on this?

In the meantime I commented out line 17 and my admin section works. It's screwed up looking but it works and I can administer the forum.

Well, I take that back. That didn't work. It did allow me to see the Admin area but I there was no way to save any changes to the forum configuration....Obviously, cause there was no toolbar..

You can hit me now...

Doesn't work on Jommla 1.0.xx even though it's supposed to. Besides, it's an alpha.

Yeah, figured that it wasn't working on 1.0.X

I'd go to 1.5 but it's too much of a pain and too risky. Plus, some of the features I have now, I can't use in 1.5.

I went back to 1.0.4 Fireboard. Now I'm wondering about a different problem.
