## can't run Fireboard 1.1.0 Alpha

Posted by iosoft - 2008/05/01 11:50

---

hi

I have installed Fireboard 1.1.0 Alpha on my test site using "overwriting" (same way when I upgraded from FB.1.0.1 to FB.1.0.3 to FB.1.0.4)

But, it is showing BLANK PAGE both in Front-end as well as Back-end of FB.  
Set DEBUG MODE=1, but no error msg !!

What I am doing wrong ??

[http://gigahertz.byethost18.com/index.php?option=com\\_fireboard&Itemid=102](http://gigahertz.byethost18.com/index.php?option=com_fireboard&Itemid=102)

Well, this way I cant help. You should disable mambots, modules to see where the error is. Find what breaks it.

I have troubles too, but I get debug information:

Fatal error: Class 'JPath' not found in \var\wwwtest\com\_fireboard\libraries\joomla\html\html.php on line 128

hmmm, I think Joomla 1.0 does not have this class... ;)

I've only gotten it to run on J1.5.3. It will not run on a vanilla install of J1.0.15.

when stable, will Fireboard 1.1.x be Joomla 1.5.x exclusive ? Won't there be any support for Joomla 1.1.x ?

=====

Posted by danialt - 2008/05/02 13:01

---

---

it will support both. but keep in mind that the alpha version will not work with any modifications you have. it is a new framework.

Right ow it's not. On a BRAND NEW, UNMODIFIED Joomla 1.0.15 install (upgraded instantly from 1.0.12) running on JSAS FB 1.1 ALPHA does not run.

What are the requirements of this new framework?

doesn't work on 1.0.x right now.

I don't understand.

According to this "...we started to reshape Fireboard toward Joomla 1.5 native structure, in a way also not to break the compatibility with previous versions of Fireboard itself and also Joomla! 1.0.x version." it's supposed to.

Maybe a disclaimer should be added to the FireBoard news item saying the alpha is NOT currently compatible with J1.0.xx versions at this time.

---

A lot of people are going to be put off when they come to the realization that it doesn't work (currently) even if it IS just an alpha.

To help things along here is the error message I am getting on a blank page.

Fatal error: Undefined class name 'jpath' in W:\www\New Test\components\com\_fireboard\libraries\joomla\html\html.php on line 128

If this one has already been reported please just pass this over as I don't see a dedicated FB1.1 Alpha thread going yet.

I have another "Jfile" issue. I have done a complete installation of Fireboard 1.0.4 and I have overwritten the files as suggested and when I access the component in the backend I get the error message:

Fatal error: Class 'JToolBarHelper' not found in /homepages/3/d229978852/htdocs/lab/administrator/components/com\_fireboard/toolbar.fireboard.php on line 17

I hope this could help.

I am using Joomla 1.0.15.

By the way, lots of thanks to the Fireboard team, I think you are doing a remarkable work.

It is not based on Joomla 1.5 framework, it looks like it. It is meant to be working with J1.0.x and not only J1.5. SO, if there is an error it is a bug.

=====

Hey guys ...it's alpha, it's not even beta, not RC1, 2,3 ...I don't now why some of you are getting upset like it's some product you paid for in advance, a bit more positive attitude won't kill you ;)

I can confirm though that it doesn't work on J1.0.X yet, I commented out those lines I got an error message for to get backend and front-end working, still back-end looked like 1.0.4 after that, and front-end template displayed some error text because it obviously missed some lines.

=====

I will look into the problem. It is supposed to work in J1.0.x after all :)

I did a clean install 1.0.4/overwrite with 1.1 on a test server and get a 500 in the administrative side, but the frontend is fine. Anyone point me to a solution?

Fatal error: Undefined class name 'jpath' in W:\www\New Test\components\com\_fireboard\libraries\joomla\html\html.php on line 128

I'm using J! 1.0.15

---

## Re:can't run Fireboard 1.1.0 Alpha

I have similar problem :( :unsure:

Fatal error: Class 'JToolBarHelper' not found in /home/allaturc/public\_html/administrator/components/com\_fireboard/toolbar.fireboard.php on line 17

:( :(

---

## Re:can't run Fireboard 1.1.0 Alpha

Posted by Siberiantiger - 2008/06/18 13:00

---

I have the very same problem as 'lehfan' does in Joomla backend (Fireboard)

Fatal error: Class 'JToolBarHelper' not found in /home/tjellen/public\_html/administrator/components/com\_fireboard/toolbar.fireboard.php on line 17

I am using Joomla 1.0.15 and upgraded from Fireboard 1.0.4 to 1.1 alpha using overwrite files

When will there be a fix for this?

---

## Re:can't run Fireboard 1.1.0 Alpha

Finally I managed to make a clean install of FB 1.1.

My Report -  
Every single BUGs of 1.0.4 are present in FB1.1 and its more slower !!

---

What are you doing man ? You are breaking my heart..... :(
